

## **MULTI-FUNCTION CHARGER**

### **Field of the invention**

The present invention relates to a portable multi-function charger, especially to a portable multi-function charger connected to notebook computer,

- 5 wall socket, vehicle power socket and battery to supply electric power to electronic devices or charge the rechargeable battery.

### **Background of the invention**

- The portable electronic devices such as notebook computers, cellulous phones and PDA become indispensable to modern people. Consequently, the portable electronic devices require rechargeable battery (such as Li battery, 10 NiH battery or NiCd battery) for electric power and a charger is needed to charge the rechargeable battery.

- However, the conventional charger has only limited charging function. For example, the conventional charger generally cannot perform charging operation 15 for multiple batteries.

### **Summary of the invention**

- It is the object of the present invention to provide a portable multi-function charger, which can be electrically connected to portable electronic device, wall socket, vehicle charger or battery for inputting electric 20 power. Therefore, the multi-function charger has flexible electric power sources. The inventive multi-function charger can be used to simultaneously charge a plurality of portable electronic devices and rechargeable battery and has compact size for convenience of carrying.

To achieve above object, the present invention provides a portable

multi-function charger for electronic devices comprising a body, a circuit section, an input end, an output end, an output cord and a battery connector.

The body has a cavity therein to receive the circuit section. The circuit section has a circuit board therein and having a plurality of spring contacts. The input  
5 end, the output end, the output cord and the battery connector are connected to the circuit board. A mounting stage is arranged on outer surface of the body and has a plurality of contacts therein.

The various objects and advantages of the present invention will be more readily understood from the following detailed description when read in  
10 conjunction with the appended drawing, in which:

**Brief description of drawing:**

present invention.

### **Detailed description of the invention**

With reference to Figs. 1, 2 and 3, the present invention is intended to provide a portable multi-function charger for electronic devices. The

5 multi-function charger 10 according to the present invention comprises a body 11, a circuit section 12, an input end 13, an output end 14, an output cord 15 and a battery connector 16. The body 11 is a hollow case composed of a first half 17 and a second half 18 assembled by locking, screwing, supersonic welding. The body 11 has a cavity 19 therein to receive the circuit section 12.

10 The circuit section 12 is composed of a circuit board 20 and a plurality of electric components 21. The circuit board 20 is received in the cavity 19 and has a plurality of indication lamps 22, 23 thereon. The indication lamps 22, 23, for example, can be LED or light bulbs and are used for status indication, or lightening and warming function. The body 11 has transparent mask 24 and  
15 through hole 25 corresponding to the indication lamps 22, 23 to facilitate the light emission of the indication lamps 22, 23. Moreover, the circuit board 20 has a plurality of spring contacts 26 electrically connected thereto.

The input end 13, the output end 14, the output cord 15 and the battery connector 16 are connected to the circuit board 20. The output cord 15 is also  
20 connected to a plug 27 connected to a portable device such as a cellulose phone. The input end 13 is connected to a plug 29 of an input cord 30, which is also connected to a USB connector 31.

The body 11 has a mounting chamber 28 on outer surface thereof and the mounting chamber 28 can be integrally formed with the body 11 by injection

molding or detachably assembled to the body 11. In this preferred embodiment, the mounting chamber 28 is integrally formed with the body 11. The mounting chamber 28 can be arbitrary shape with open topside such that rechargeable battery can be placed within the mounting chamber 28. One end of each spring contact 26 extends into the mounting chamber 28.

With reference to Fig. 4, the USB connector 31 on the input cord 30 is plugged to the DC power output port of a portable electronic device 50 such as a notebook. Therefore the input end 13 is electrically connected to the portable electronic device 50 to provide electric power to the multi-function charger 10.

The rechargeable battery 51 to be charged is placed in the mounting chamber 28 such that the contacts of rechargeable battery are in contact with the spring contacts 26 and the rechargeable battery 51 can be charged through the spring contacts 26. Therefore, the portable multi-function charger can be functioned as a charging stage.

Moreover, a portable electronic device 52 to be charged can be connected to the plug 27 of the output cord 15 such that the portable electronic device 52 can be charged through the plug 27. Therefore, the portable multi-function charger can be functioned as a traveling charging suit.

With reference to Fig. 5, the plug 27 of the output cord 15 can be connected to another charger 53 to charge the rechargeable battery 54 placed in the charger 53.

With reference to Fig. 6, the battery connector 16 is connected to commercially available dry battery 55 and the portable electronic device 56 to be charged is connected to the plug 27 of the output cord 15 such that the

multi-function charger 10 is powered by the dry battery 55 and can charge the portable electronic device 56 to be charged. Therefore, the portable multi-function charger 10 can be functioned as a traveling charging suit.

With reference to Fig. 7, a commercially available power adapter 57 can be plugged to an 110V (220V) AC power source through a plug 58 thereof to convert an AC electric power to a DC electric power. The input end 13 of the inventive multi-function charger 10 is electrically connected to the power adapter 57 through an input cord 59 and then a plug 61 of a portable electronic device 60 such as a notebook computer is connected to the output end 14 of the multi-function charger 10. Therefore, the DC power converted by the power adapter 57 can be supplied to the portable electronic device 60 through the multi-function charger 10 or used to charge the rechargeable battery of the portable electronic device 60 through the multi-function charger 10.

At the same time, a rechargeable battery 62 to be charged can be placed into the mounting chamber 28 such that the contacts of rechargeable battery are in contact with the spring contacts 26 and the rechargeable battery 51 can be charged through the spring contacts 26. Moreover, another portable electronic device 63 to be charged is connected to the plug 27 of the output cord 15 such that the portable electronic device 63 can be charged through the plug 27.

With reference to Figs. 8 and 9, the input end 13 of the inventive multi-function charger 10 is electrically connected to a plug 64 and the plug 64 is connected to an adapter plug 66 through an input cord 65. The adapter plug 66 can be connected to an 110V (220V) AC power source as shown in Fig. 8. Moreover, the plug 64 is connected to a vehicle charger plug 67 through an

input cord 65 as shown in Fig. 9. Therefore, the multi-function charger 10 can be powered by DC power through the vehicle charger plug 66.

Moreover, the input end 13 of the inventive multi-function charger 10 can be electrically connected to portable electronic device such as notebook

5 computer, wall socket, vehicle charger for inputting electric power, or connected to dry battery through the battery connector 16 to acquire DC electric power. Therefore, the inventive multi-function charger 10 has flexible electric power sources. The inventive multi-function charger 10 can be used to simultaneously charge a plurality of portable electronic devices and  
10 rechargeable battery and has compact size for convenience of carrying.

As can be shown in Fig. 10, the output cord 15 of the inventive multi-function charger 10 can also be connected to plugs or connectors 32 of various types.

With reference to Fig. 11, the body 11 contains a spool unit 33 and the  
15 output cord 15 is a flat cable wrapped around the spool unit 33. Therefore, the output cord 15 can be scrolled into the body 11 or pulled out of the body 11. The output cord 15 will not have the problem of overlong or over short length.

With reference to Figs. 12 and 13, the mounting chamber 28 according to the present invention can be detachably assembled to the body 11. The  
20 mounting chamber 28 has two connection tabs 34 on both sides thereof and each of the connection tabs 34 has a clamping section 35 therein. The body 11 has at least one clamping tooth 36 on both sides thereof resiliently engaged with the clamping section 35 such that the mounting chamber 28 is adjustably arranged on the body 11. The mounting chamber 28 can be pulled out or

pushed in with respect to body 11 to adjust a receiving space therein and to accommodate batteries of various sizes. Moreover, the mounting chamber 28 can be detached from the body 11 when not being used, or pressed downward to reduce size. Moreover, the mounting chamber 28 can also be designed to be  
5 movable in altitude direction to fit batteries of various heights and the size thereof can be further reduced when not being used.

With reference to Figs. 14, 15 and 16, the body 11 has a foldable mounting chamber 37 pivotally arranged on outer side thereof. The mounting chamber 37 is a hollow shell with arbitrary shape and open topside such that a  
10 portable electronic device 38 can be inserted into the mounting chamber 37 from its top opening. The mounting chamber 37 has a plurality of contacts 39 therein and connected to the circuit board 20 through conductive wires 40. When the portable electronic device 38 is placed into the foldable mounting chamber 37, the contacts thereof are in contact with the contacts 39 and  
15 electrical power is sent to the portable electronic device 38 through the contacts 39. Moreover, when the foldable mounting chamber 37 is not in use, the foldable mounting chamber 37 can be folded upward and cover on the body 11 to save space as shown in Fig. 14.

With reference to Fig. 17, the body 11 has an accommodation groove 41  
20 on top surface thereof and the accommodation groove 41 has open topside to receive batteries therein. The accommodation groove 41 has a plurality of contacts therein and connected to the circuit board 20. When the batteries 42 are inserted into the accommodation groove 41, the batteries 42 are in contact with the contacts of the accommodation groove 41 and can be charged through

the contacts of the accommodation groove 41.

With reference to Fig. 18, the circuit board 20 of the circuit section 12 has an output cord 43, by which the circuit board 20 can be connected to other portable electronic devices.

5           With reference to Fig. 18, the body 11 has a clip 44 on outer surface thereof and being able to clamp on belt of user for carrying.

Although the present invention has been described with reference to the preferred embodiment thereof, it will be understood that the invention is not limited to the details thereof. Various substitutions and modifications have

10           suggested in the foregoing description, and other will occur to those of ordinary skill in the art. Therefore, all such substitutions and modifications are intended to be embraced within the scope of the invention as defined in the appended claims.
